1. TRIGGER 

New Item in Feed

RSS by Zapier

New Item in Feed

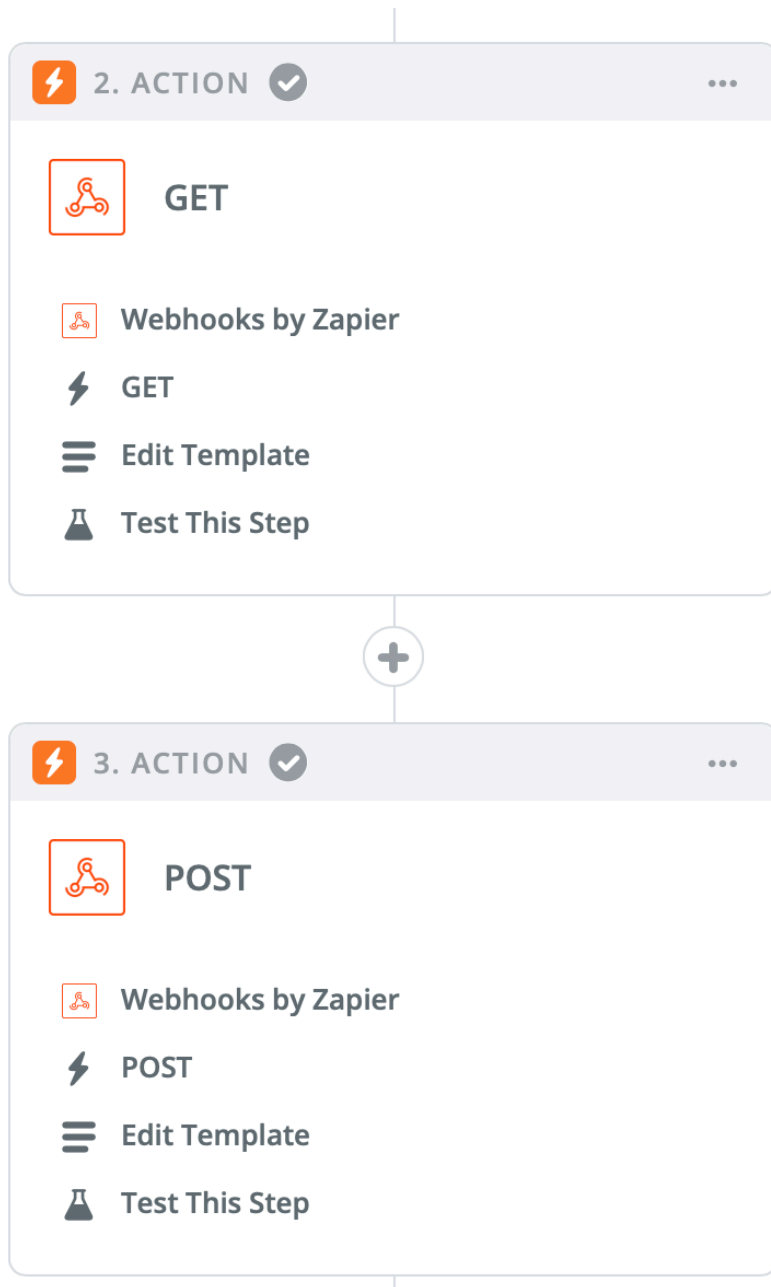

Edit Options

Test This Step

The first one starts by grabbing the RSS feed from Relay and it's triggered by new episodes

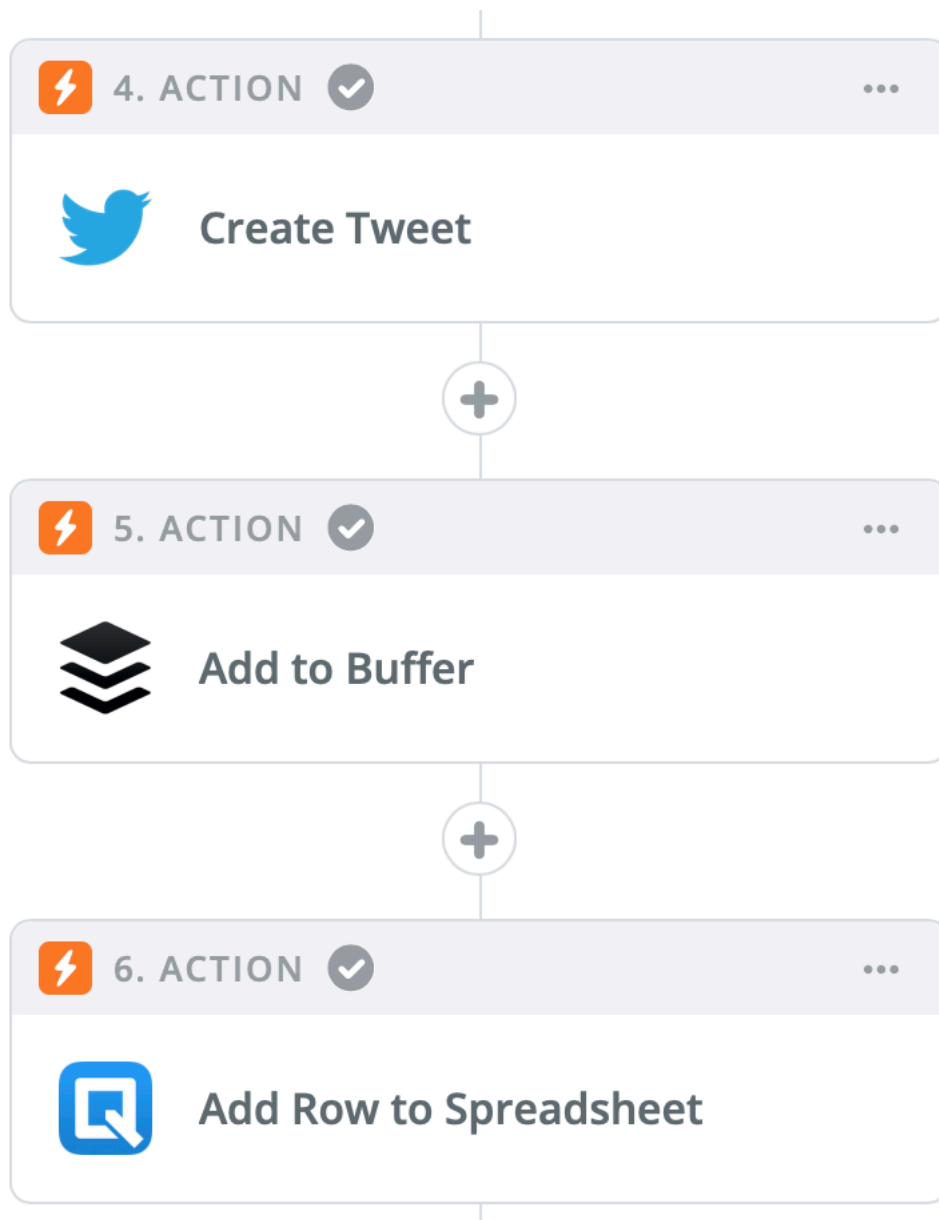

It then triggers a script on my server which creates a blog post, and POSTs the episode to the Automators forum:

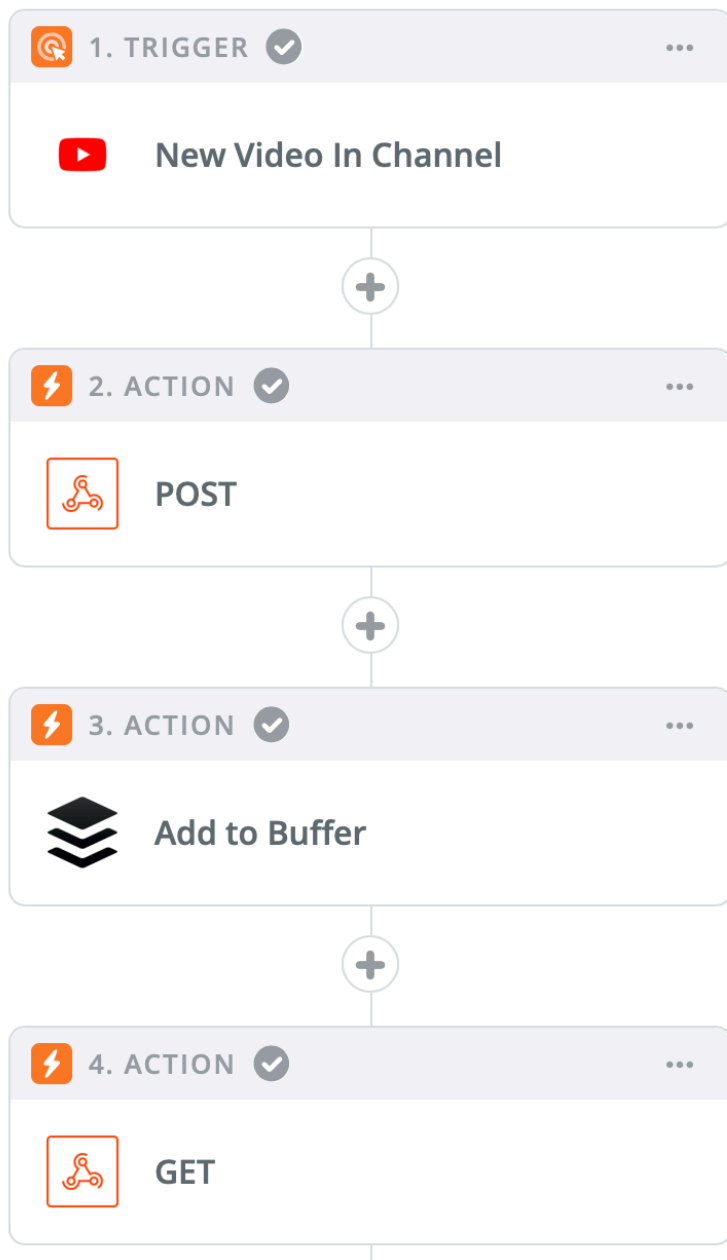

Data (optional)

These are key-value pairs that will form the data portion of the request. If you leave these empty, all fields from the previous step will be used. If you want to send your own raw JSON or form-encoded values here, please use the **Custom Request** action instead.

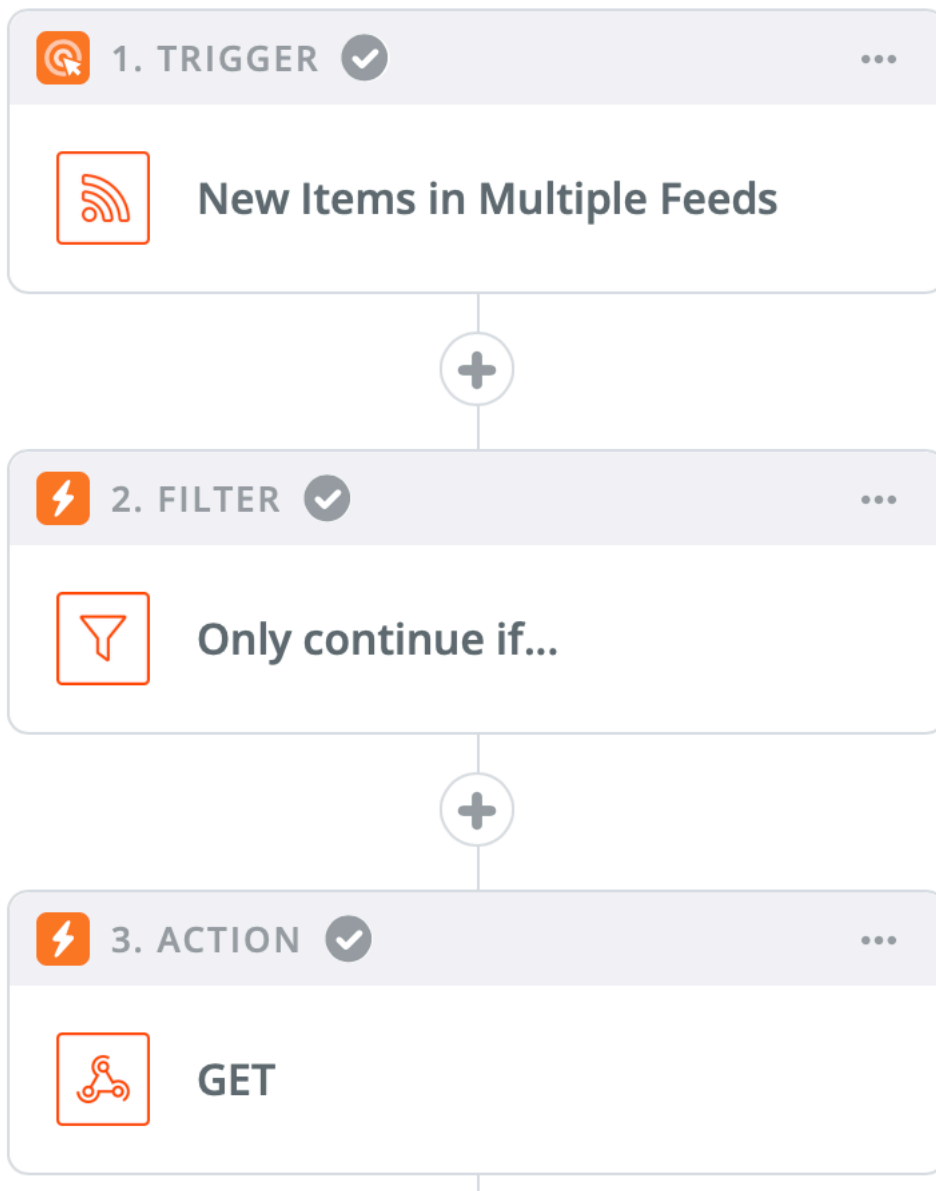

category	10		-
raw	 Step 1 https://example.com/blog/some-post/		-
tag	episode		-
title	 Step 1 An Example Blog Post Title		-

The next steps are tweeting the new episode, adding the forum link to Buffer (at the top so it will be the next tweet that gets posted), and and adds the forum post to our Quip document.

Videos: every time a new youtube video is posted it gets posted to the forum, added to buffer to be tweeted, and again a script on my server gets triggered to make a new video post.

This is our blog posts: it has the RSS feed from your blog and my blog in it, if it has the word Automators in the title a script on my server is triggered to create link posts.
